Andrey Shigantsov

Senior Rust Backend Developer

a.shigantsov@gmail.com | Telegram: t.me/rasaro89

GitHub: github.com/andrey-shigantsov | GitLab: gitlab.com/andrey-shigantsov

Portfolio: docs.google.com/presentation/d/1cu0rpvXFcqgHSNspt4M0GizctlspQlxM6nvBHP9CE2k

SUMMARY

Senior Rust backend developer, 15+ years of experience. I build production backends in Rust: from microservices and Solana smart contracts to embedded software (including C/C++).

I set engineering standards in the team: TDD, code review, technical documentation. I use AI-agent workflows as one of the development tools — planning → agent implementation → multi-stage review → manual control — and personally own the quality of the final code. I help streamline business processes: experience as a Scrum Master and running a project as a PM. Ready to grow into a Tech/Team Lead role.

Desired role: Senior Rust Backend Developer with further growth into Tech/Team Lead, full-time, remote

EXPERIENCE

BridgeApp

Rust Backend Developer — Aug 2025 – Jul 2026 (11 months)

Remote · Distributed team of Rust developers · Agile

Collaboration platform. Backend development in Rust (tokio, gRPC, Kafka/Redpanda, Redis, sqlx + PostgreSQL).

- Designed and rolled out an integration auto-testing system for gRPC services (sqlx-based tests in Rust) — by own initiative, where no automated testing had existed before; it became the company-wide testing standard.
- Implemented health-checks across the entire backend (20+ microservices), each probing its own state and its dependencies on other services and external systems (Kafka, PostgreSQL, Redis).
- Extended the `tasks` and `history` microservices to power the front-end home page.
- Added a templated marketing-email system to the CRM microservices.
- Unified data filtering by arbitrary fields (including user-created custom fields) across the `databases` and `tasks` services.
- **Open source:** github.com/MathAndMagic/bql — authored the spec for the BQL unified query language and a generator that produces parser + formatter libraries for all required languages (Rust, TypeScript, Swift, Kotlin).
- Contributed to the refinement, refactoring, and bug-fixing of critical microservices (`idm`, `messenger`, `projects`, `tasks`).

STREAM TECH LLC (ООО «СТРИМ ТЕХ»)

Rust Backend & Solana Developer — Nov 2022 – Aug 2025 (2 years 9 months)

Remote · Distributed team of Rust developers · Agile

Backend services and on-chain programs for blockchain products.

- Developed Rust backends (tokio, PostgreSQL, Solana).
- Developed and maintained smart contracts for the Solana blockchain.
- **Open source:**
 - github.com/texture-fi/price-proxy — Solana contract providing unified access to fresh prices from multiple arbiters; developed the system core and the testing system.
 - github.com/texture-fi/common/tree/master/macros — shared macros used across all contracts, programs, and services.
 - github.com/texture-fi/anchor-interface — lightweight library for interacting with anchor-lang smart contracts.

TRADETECH DEVELOPMENT LLC (ООО «Трейдтех Девелопмент»)

Rust Backend & Solana Developer — Apr 2021 – Nov 2022 (1 year 8 months)

Fully remote · Distributed team of Rust developers · Agile

High-load microservices and Solana DeFi infrastructure. Held partial project-lead responsibilities alongside development.

- **Project-lead duties:** team coordination, task tracking in Jira, planning and organizing work, daily progress monitoring, reporting on results.
- Built high-load microservices on async-I/O Rust (tokio, serde, prost, ClickHouse).
- Developed smart contracts for the Solana blockchain.
- **Key achievement — DEX-connector smart contract** (Leveraged Staking project for texture.finance): a Solana contract for unified token exchange across multiple decentralized exchanges. At the time of writing it supported Orca / Whirlpools; the contract executes large-volume swaps distributed over time in small portions to minimize market impact.
- **Key stack applied on the project:**
 - **Solana:** shipped smart contracts with automated test suites (solana-program-test, solana-test-validator) and Rust-client integration.
 - **ClickHouse:** owned schema design and maintenance, ran migrations via golang-migrate, integrated via the Rust client.
 - **Grafana + Prometheus:** instrumented Rust services with metrics and built advanced observability dashboards.
 - **Apache Kafka:** implemented high-throughput consumers in Rust.
 - **Docker:** containerized services for deployment.

Siber Systems Inc

C++ Full-Stack Developer — Sep 2019 – Mar 2021 (1 year 7 months)

Development and support of C++ software for Windows and Linux (including NAS).

- Independently learned Siber Systems Inc's cross-platform libraries.

- **In the GoodSync product:**

- implemented file sync with Google Photos via the REST API;
- identified root causes and fixed several critical bugs reported by users.

KV-SVYAZ (НПООО «КВ-связь»)

C/C++ Programmer — Mar 2017 – Sep 2019 (2 years 7 months)

Software Development Project Lead / Scrum Master — Mar 2019 – Aug 2019 (6 months)

Embedded and application software for communication systems.

- Developed embedded software in C (HOST, DSP) on Cortex-Mx and TMS320C674x cores.
- Developed application software in C++ with Qt.
- Authored technical documentation and typeset documents in LaTeX.
- **As Project Lead / Scrum Master:** strategic and operational planning, delivery to the customer, and oversight of the development process.

Freelance

Software Engineer (C/C++) — Apr 2015 – Apr 2016 (1 year 1 month)

Contract embedded and application software for communication systems and devices.

- Developed embedded software in C (HOST, DSP) on Cortex-Mx and TMS320C55xx cores and application software in C++ with Qt; authored and typeset technical documentation in LaTeX.
- **NAVDAT-RUS receiver prototype** for Central Research Institute "Kurs" (ЦНИИ «Курс»): a specialized OFDM communication channel — built the Intel-PC-based transmitter and the ZedBoard/Linux-based receiver, plus a PC-based channel test.
- **PC-1000 POS terminal firmware:** built the firmware, the `cmake` toolchain, and a PC simulator for debugging.

Omsk Scientific Research Institute of Instrument Engineering OJSC

Software Engineer (2nd category) — Feb 2010 – Mar 2015 (5 years 2 months)

Embedded and application software for communication and navigation systems.

- Developed embedded software in C (HOST, DSP) on Cortex-Mx and TMS320C55xx cores and application software in C++ with Qt; authored technical documentation.
- Self-taught microcontroller programming and the fundamentals of digital signal processing (DSP) on the job — the foundation for all later embedded work.
- **NAVTEX "Fregat" receiver** (www.oniip.ru/produkcia/detail.php?SECTION_ID=120&ELEMENT_ID=745): participated in development and certification; built the NAVTEX transceiver, its test suite (incl. on PC), and parts of the GUI, INS, and Alarm services.

EDUCATION

Specialist Degree, Information Security (Comprehensive Information Security of Automated Systems)

Siberian State Automobile and Highway Academy (СибАДИ)

2006 – 2011

SKILLS

- **Methodologies:** Agile/Scrum
 - **Languages:** Rust (primary), C/C++
 - **Backend:** tokio, gRPC, REST, serde, prost, async-I/O
 - **Data & Messaging:** PostgreSQL (sqlx), ClickHouse, Redis, Apache Kafka / Redpanda
 - **Blockchain / Solana:** smart contracts, anchor-lang, DEX integrations, solana-program-test, solana-test-validator
 - **Observability:** Prometheus, Grafana
 - **Tooling & DevOps:** Docker, Git, CI/CD
 - **Documentation:** Markdown, LaTeX
 - **AI-agent workflows:** plan → implementation → multi-stage review loop
 - **Agent engineering:** rules, skills, and tech docs as persistent agent memory
 - **Spoken languages:** Russian (Native), English (A2 – Pre-Intermediate)
-

RECOMENDATIONS

Latish Vladislav
Backend Team Lead, MathAndMagic

To Whom It May Concern

Subject: Reference for Andrey Shigantsov

Dear Sir or Madam,

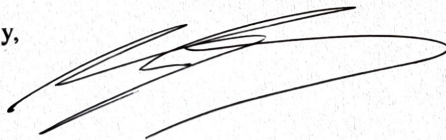

I worked with Andrey Shigantsov at MathAndMagic on the BridgeApp project, where he was involved in backend development for a microservice platform.

Andrey contributed to several important areas of the project, including task and workflow management, CRM and marketing campaigns, messaging services, user management, notifications, and activity history. He also worked on shared technical improvements, including service health checks, migration tooling, and integration testing.

Andrey actively participated in discussing and refining tasks, proposed solutions, and took responsibility for their implementation. He was engaged, responsible, and communicative. It was easy to work with him on both technical and organisational matters.

I am pleased to recommend Andrey as a backend developer who can work independently on complex tasks and collaborate constructively with a team.

Yours faithfully,

Latish Vladislav

Backend Team Lead

MathAndMagic
